

Document Classification Application

Application Version: 2022.3

Revision: 22-07-19

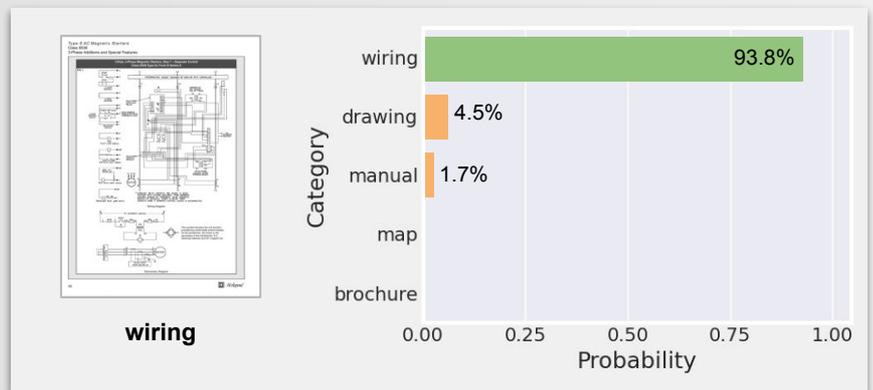

The FirstStep.ai Document Classification uses robust AI models designed for high-speed **Document Classification**. Available **on-premise**, the Document Classification application can be **trained** to classify **your specific industrial documents**, from wiring diagrams to maintenance manuals.

Document Classifier

FirstStep.ai offers an on-premise classification application that can be trained to classify your industrial documents, from wiring diagrams to maintenance manuals.

AI classification removes human error, and automates the classification process, processing documents efficiently and consistently.

Any document that is not confidently classified can be escalated to a human for manual classification, and can also be used to improve the AI model.

P&ID Document Reader

FirstStep.ai offers an on-premise P&ID document reader, that processes technical documents to digitize and dynamically tag components in static documents.

This application works together with the Document Classification application to first determine how to process each type of technical document.

This application can be configured to process various types of technical documents including P&ID, wiring, and building schematics.
